

Instructions for Setting Up the Azure Web App

Open your terminal and follow the steps. You need to make sure you have installed Azure CLI.

Step 1: Log into Azure.

```
az login
```

Step 2: Let's create a resource group with the name hogwarts-resource-group.

```
az group create --name hogwarts-resource-group --location eastus
```

Step 3: Let's create an App service plan.

```
az appservice plan create --resource-group  
hogwarts-resource-group --name hogwarts-app-service-plan  
--is-linux
```

Step 4: Let's create an Azure App Service. We will use it to host our Spring Boot application.

```
az webapp create --name hogwarts-artifacts-online --plan  
hogwarts-app-service-plan --resource-group  
hogwarts-resource-group --deployment-container-image-name  
nginx:latest
```

The Azure App Service name must be unique. So, you need to give your web app a new name, e.g.,

hogwarts-artifacts-online-yourFirstName-yourLastName
